Like a power drill, an impact driver is a handheld tool mainly used to drive screws. Compared to the power drill, an impact driver has a significantly greater rotating force, produced in extremely quick bursts— up to 50 times per second— generating a very powerful torque that is able to quickly and easily run large screws and other fasteners in hard materials. Another difference between strength exercises and impact drivers is that the latter is not a chuck; Instead, the effect drivers have quick release legs that fit all 1/4 inch hex driver bits. While a power drill is enough for the tasks around the house, if you're facing a project that includes a large amount of wooden screws-building decks, assembling a child's swing set, or installing fences, for example- you'll appreciate the power, ease and light weight of the impact driver on the power drill. For monitoring the driver's power level, an easy LED power level meter is accessible on the side at any time you want. Many people forget that the effect driver is just a part of the equation. While many effects can share different types of drivers and practice bits, just having a dedicated set for the effect driver can save time. The impact driver is capable of giving 1,300 inch pounds of torque. In addition to driver and drill attachments, Black+ Decker has also developed other attachments such as an orbital sander and jigsaw in its huge Matrix Quick Connect system. Since practice and impact drivers can go hand-in-hand on most projects, it makes sense to put both in a well-equipped tool box. For companies that use the same battery for most of their power devices, a different charger with the impact driver means you can get the battery ready to use for multiple devices at once. Best of all, you can put an extra battery around to charge when using the effect driver so you never walk out of the juice.
